

Figure 3.5 (Top) Time series of total and relative atmospheric angular momentum AAM as defined in Eq. (3.6) indicated by the red and blue curves, respectively, together with length of day LOD indicated by the black curve. The interdecadal variability in LOD attributable to motions in the Earth's mantle has been removed and the curve has been scaled in accordance with Eq. (3.7) to make it compatible with the AAM curves. The scales at the left and right are different because the total AAM contains the almost constant solid body rotation component. The LOD scale in units of milliseconds is also included at the far right. (Bottom) The corresponding anomalies with respect to the seasonally varying climatological means. Courtesy of Ying Li.
